ProntoForms®

ProntoForms is a Canadian company that develops low-code software and mobile apps used by 100,000+ subscribers. The tools empower enterprise field service management in streamlining their processes through forms that can be quickly built, maintained and deployed to their field service technicians’ phones.

Global Components

Users want to build a section of questions and use it across multiple forms. Currently, a section, its contents are restricted to one form. With a method to build a section and use it in different forms, users can save time and, in compliance cases, ensure all instances are always up to date.

Problem & Opportunities

User Flow

These were a few things that had to be kept in mind while working on flows and to meet users' needs:

- How does accessing & editing the original work?
    - Users
    - FormSpaces/Forms
    - Permission controls + versioning
- Where are the components stored?
- How do we show what has been changed?
- Will some updates need to be forced by upper management and not clearly shown in forms?

Formspace 1

Formspace 2

Forms

Resources

- Images/PDFs
- Data Sources

Components

Scope

- Creating + editing a component
- Components will be a single section
- Notifying about components updates
- Reviewing the component changes
- Unlinking from the source component
- Components live in a formspace

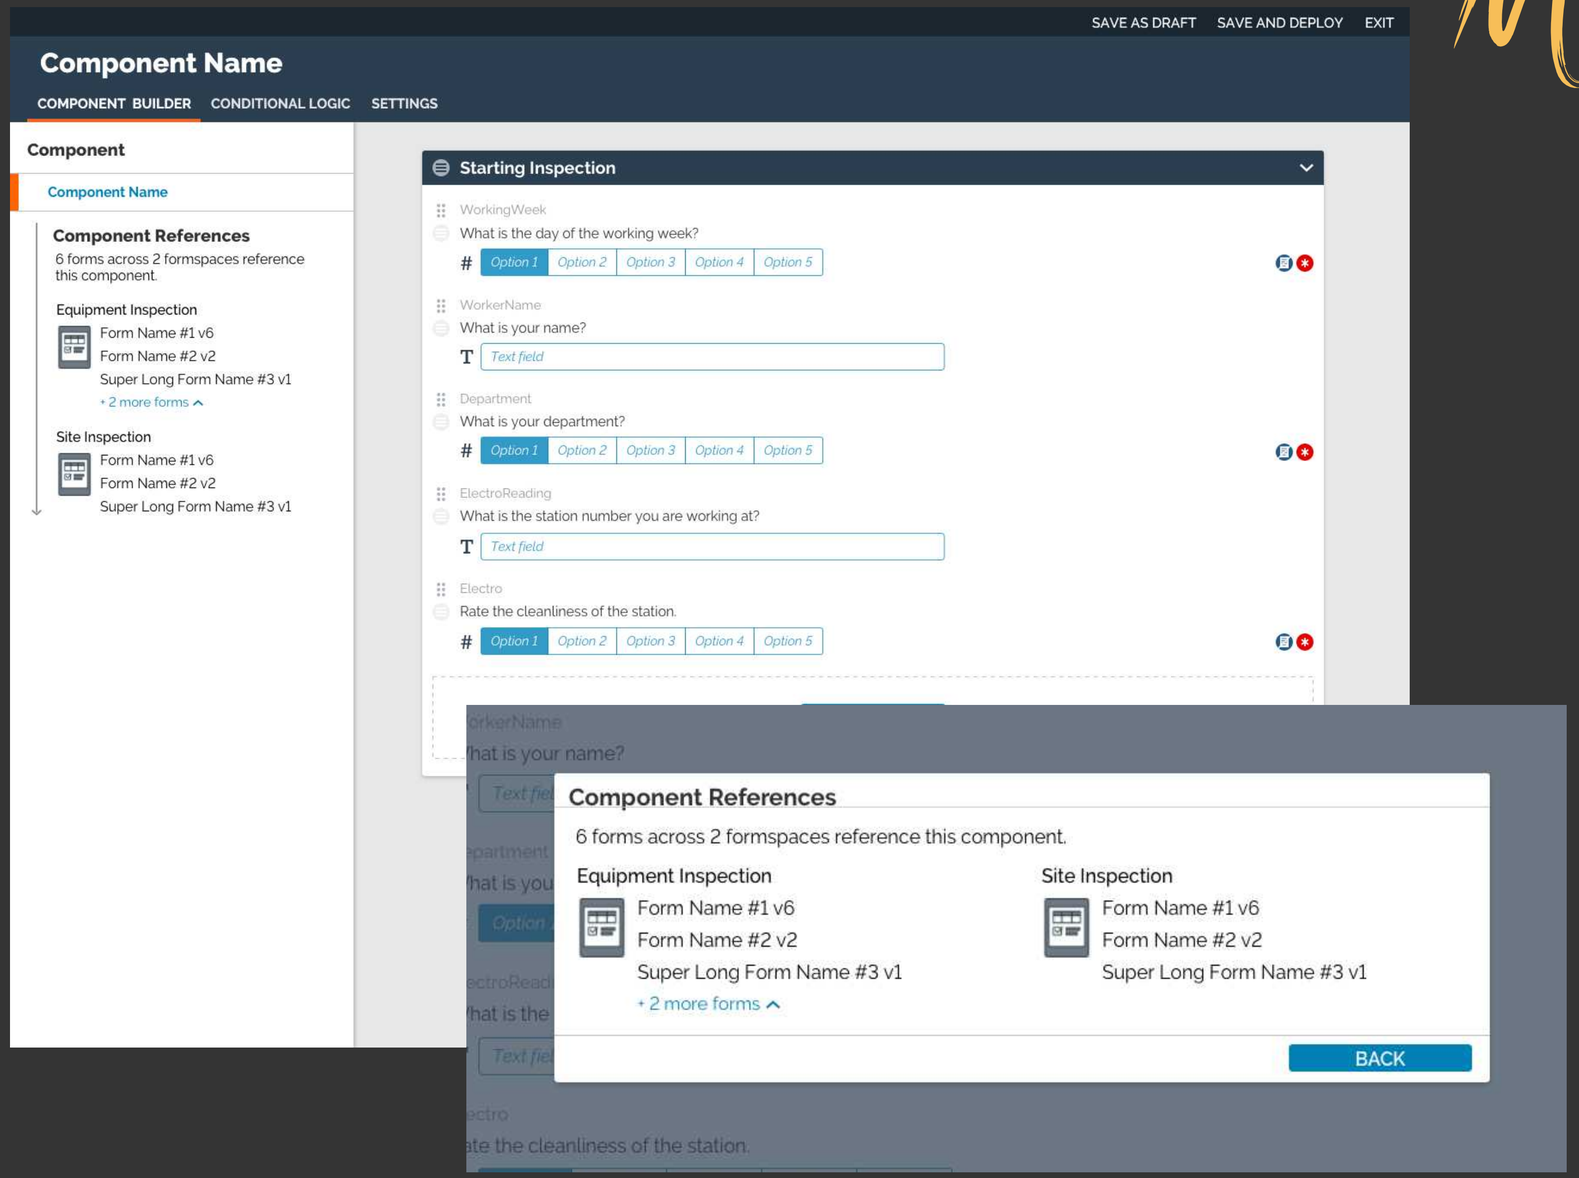

Not in Scope

- Forced component updates
- Components with multiple sections or pages
- Settings for component use in forms
  - Position/must be used
  - If they can be unlinked or not
- Components being used across formspaces

Design

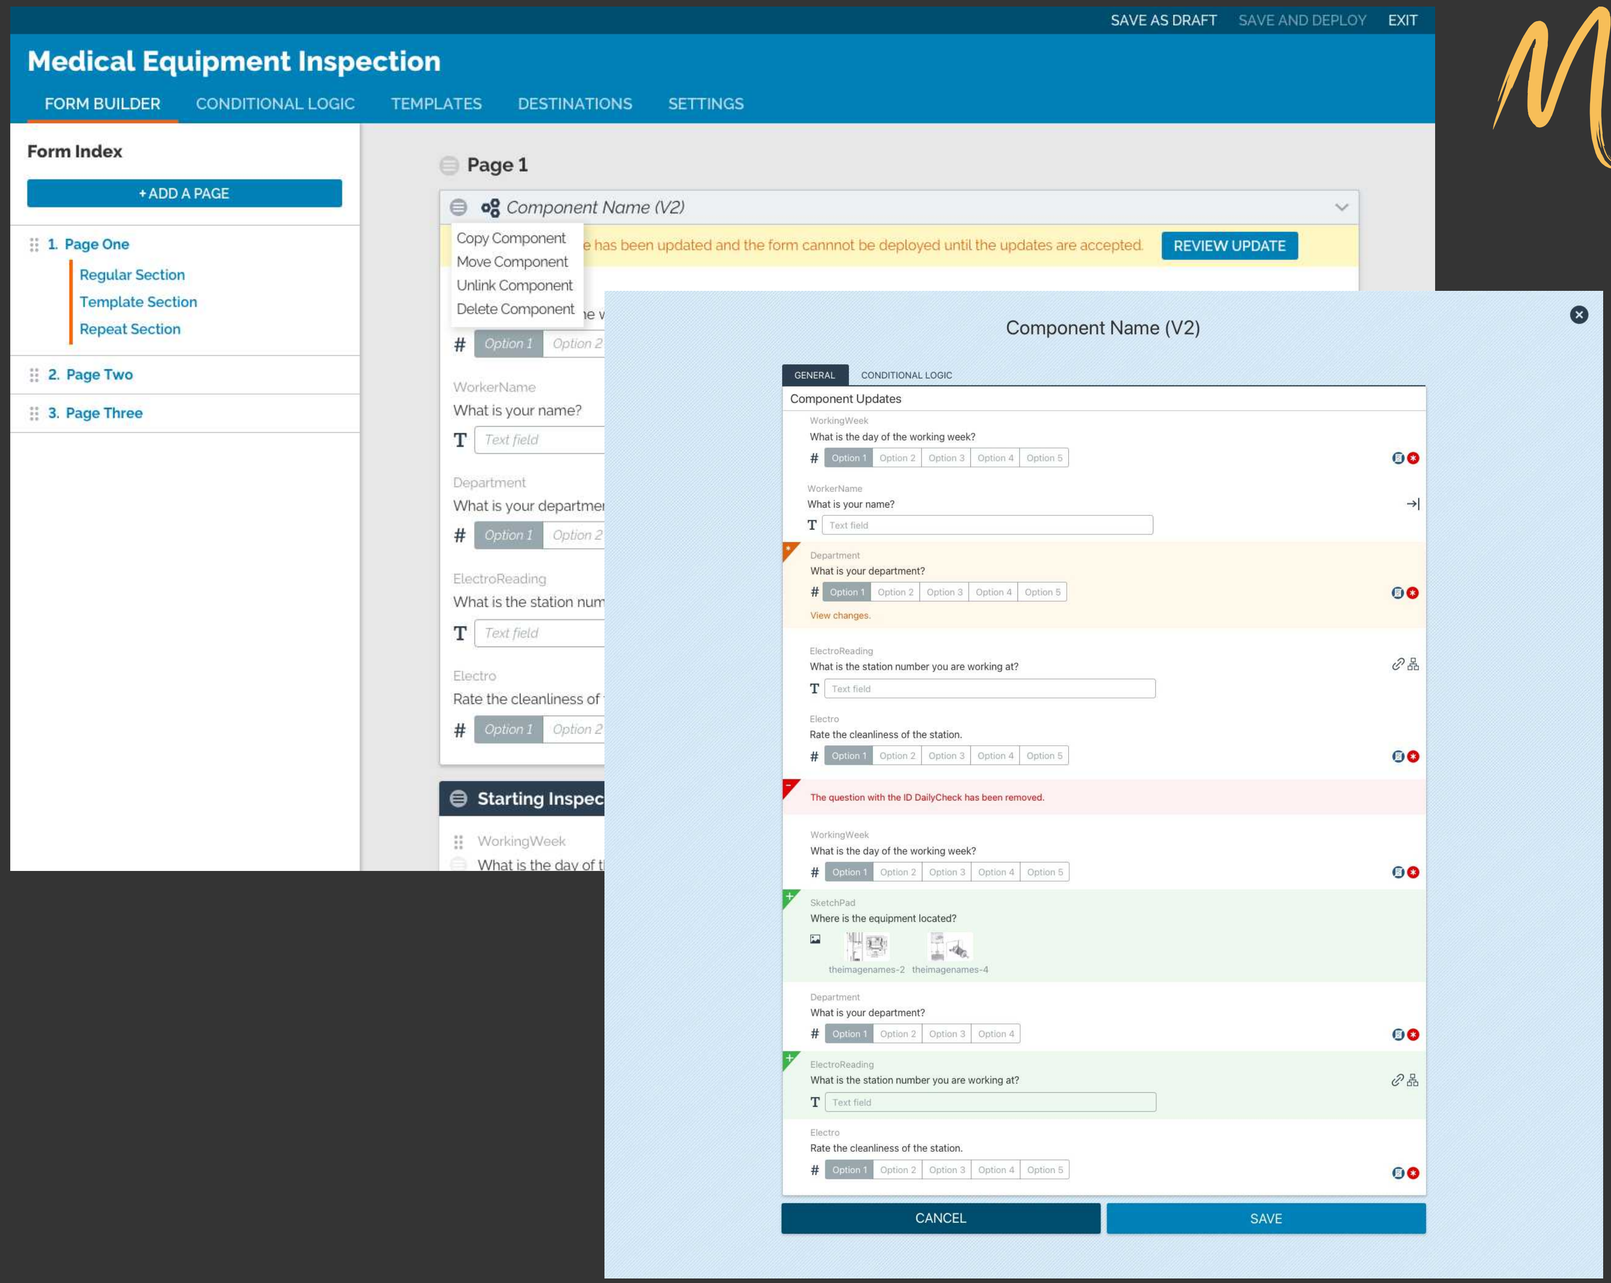

Design

- Where can we display which forms use a component?
  - Will users need support for multiple sections and pages?
- Multi-language support – tied to region (future feature)

Design

- How do we flag that a component has been changed and needs to be reviewed?
  - In the Portal & Form Builder
- How do we show updated, new or deleted questions and conditional logic in a section?
- What if a user feels that changes in the component aren't relevant to their form?
- Can users deploy forms without updating components inside? What happens?

Next Steps

Next Steps

User testing + revisions

Determining milestones

Getting feedback
after full launch

Revisiting milestones

Integrated Feedback

Creating a modal to collect feedback about the feature and receive feedback.

Support Stats

Checkin with support about if users are calling into get support with the feature and what are the trends.
